

A New Spider Species from Bulgaria, *Harpactea alexandrae* sp. n. (Araneae: Dysderidae)

Stoyan Lazarov

Abstract: A new spider species from Bulgaria, *Harpactea alexandrae* sp. n. (Araneae: Dysderidae) is described and illustrated only by male specimens collected in North-East Bulgaria (North Black Sea coast) (Fig. 1). The male palps of the new species resemble those of *H. rubicunda* (C. L. KOCH, 1838) (Fig. 5-6), but the embolus is more massive and long (Fig. 2-4). The form of bulbus is also different.

Key-words: Description, Dysderidae, new species, North-East Black Sea coast, Bulgaria
