**Abstract:** The Danube salmon (*Hucho hucho*) has been the only salmonid species reported for the Bulgarian sector of the Danube River in the Bulgarian ichthyological literature so far. Recently, one salmonid specimen was recorded near the town of Ruse (river km 495). Based on morphological characteristics and comparison with another salmonid specimen from the mouth of the Veleka River (Black Sea tributary), this species was identified as the Black Sea salmon (*Salmo labrax*).

**Key words:** *Salmo labrax*, Danube River, Bulgaria
