Abstract: *Harpactea kubrati* sp. n. is described and illustrated from male specimens collected on the North Black Sea coast of Bulgaria. The male palps of the new species resemble those of *H. logunovi* Dunin, 1992, but the embolus is not bifurcate, spiral-shaped and longer, the conductor is more massive and the form of bulbus is also different.

Key words: Araneae, Dysderidae, *Harpactea kubrati*, new species, Bulgaria
