Abstract: A new wingless ground beetle, *Calathus (Calathus) jakupicensis* **nov. sp.** (type locality: subalpine zone of Karadzica Mt., Jakupica Massif, Macedonia) is described. The diagnostic characters of the species are defined and illustrated, making possible its recognition. The new species is eastern vicariant and adelphotaxon of *C. (C.) ravasini* J. MÜLLER.

Key words: Coleoptera, Carabidae, Palaearctic, Macedonia, new species
