Abstract: The new species is described and illustrated by male and female specimens collected in North-East Bulgaria (Kranevo and Albena). The male palps of the new species resemble those of *Harpactea strandjica* DIMITROV, 1997, but the embolus is more slender and curved not bifurcated apically. The conductor is lamelliform, provided with hook-form growth.

Keywords: Dysderidae, new species, Bulgaria, North Black Sea coast
