**Abstract:** A larvae of a new species of *Leptus* from Montenegro, *Leptus (Leptus) biljanae* Šundić & Haitlinger sp. n., is illustrated and described on the basis of larvae collected from an unidentified orthopteran host. In addition, *Calyptostoma velutinum* (Müller, 1776) and *Allothrombium wolmari* Haitlinger, 2000 are reported for the first time for the fauna of Montenegro.

**Keywords:** *Leptus*, larva, ectoparasite, taxonomy, new species

## Introduction

The fauna of terrestrial Parasitengona of Montenegro is poorly studied. Hitherto only fourteen species of the families Chyzeriidae, Erythraeidae, Microtrombidiidae, and Trombidiidae have been reported from Montenegro: *Parawenhoekia seadi* Saboori, Pešić & Hakimitabar, 2008, *Erythraeus (Zaracarus) budapestensis* Fain & Ripka, 1998, *E. (Erythraeus) ankaraicus* Saboori, Çobanoglu & Bayram, 2004, *E. (Z.) cf. ueckermannii* Saboori, Nowzari & Bagheri-Zenouz, 2004, *Abrolophus kotorensis* (Haitlinger, 2007), *A. montenegrinus* Saboori, Šundić & Pešić, 2012, *A. petanoviae* Saboori, Šundić & Pešić, 2012, *A. norvegicus* (Thor, 1900) (=*Hauptmannia striata* Saboori, Šundić & Pešić, 2011), *A. quisquiliarus* (Hermann, 1804) (=*Abrolophus pseudolongicollis kiejstuti* Haitlinger, 2007), *Leptus josifovi* Beron, 1975, *Moldoustium haitlingeri* Noei, Saboori & Šundić, 2013, *Eutrombidium djordjevici* Saboori & Pešić, 2006, *Arknotrombium arknesianum* Haitlinger, 2007 and *Allothrombium pulvinum* Ewing, 1917 (SABOORI & PEŠIĆ 2006a, b, HAITLINGER 2007, 2012, SABOORI et al. 2008, 2011, 2012, WOHLTMANN & MĄKOL

2012, ŠUNDIĆ & PAJOVIĆ 2012, NOEI et al. 2013). In this paper, a new species of *Leptus* is described and *Allothrombium wolmari* Haitlinger, 2000 and *Calyptostoma velutinum* (Müller, 1776) are recorded for the first time for the fauna of Montenegro. With these three taxa, the number of the terrestrial Parasitengona of Montenegro reaches 17.

## Material and methods

The examined specimens of mites were collected by M. Šundić and Biljana Šundić in Montenegro during 2011-2013. The specimens were collected from herbaceous plants as well as from an unidentified orthopteran insect using. They were preserved in 75% ethanol. Mite specimens were cleared in Nesbitt's solution and mounted in Hoyer's medium (WALTER & KRANTZ 2009). All measurements are given in micrometers ( $\mu\text{m}$ ) and calculated using a Carl Zeiss Axioscope A1 microscope with software Carl Zeiss Imaging System Axio Vision Release 4.7. The terminology of the structures and setal notation for erythraeids follows SOUTHCOTT (1992) and

HAITLINGER (1999a). The type specimens are deposited in the Museum of Natural History of Podgorica (Montenegro).

## Results

### Family Trombidiidae Leach, 1815

Genus *Allothrombium* Berlese, 1903

*Allothrombium wolmari* Haitlinger, 2000

*Material:* Fifteen larvae from herbaceous plants from meadows in Plavnica, Montenegro, 19 May 2011.

Hitherto this species was known from Poland (HAITLINGER 2000).

### Family Calyptostomatidae Oudemans, 1923

Genus *Calyptostoma* Cambridge, 1875

*Calyptostoma velutinum* (Müller, 1776)

*Material:* Three larvae from herbaceous plants from meadows in Bijelo Polje, Montenegro, 02 VIII 2011.

Hitherto this species was known from Albania, Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, France, Germany, Great Britain, Greece, Hungary, Ireland, Italy, Japan, Lithuania, Madeira, Malaya, Norway, Poland, Romania, Russia, Slovenia, Sweden, Switzerland and the Netherlands (BERON 2008, MĄKOL & WOHLTMANN 2012).

### Family Erythraeidae Robineau-Desvoidy, 1828

Genus *Leptus* Latreille, 1796

*Leptus (Leptus) biljanae* Šundić & Haitlinger sp. n.

(Figs 1-8; Table 1)

*Diagnosis:* One palpgenuala, four setae between coxae II – III, NDV = ~158, AW 87-98, Ti I 125-132, Ti III 152-162.

*Description* (based on holotype and two paratypes, larvae):

Idiosoma longer than wide. Dorsal surface of idiosoma with ~120 barbed setae in irregular transverse rows, 37-49 µm long (Fig. 2). Single eyes on circular sclerites located at level of posterior part of scutum. Scutum with concave anterior margin and distinctly barbed scutalae. Sensilla ASE and PSE, both with barbs on their 1/3 distal lengths (one ASE was broken in holotype, in paratypes both ASE were broken). Anterior and lateral part of scutum punctate. Scutum bearing two pairs of scutalae (AL and PL) similar in length (Fig.5); AL setae are nude in 1/4 of its entire length and PL covered with setules evenly distributed along the entire stem. Posterior part of scutum with cuticular lines laterally.

Ventral surface of idiosoma with pair of setae 1a, pair of setae 2a and four setae between coxae II and III, all barbed; anterior setae shorter (30 µm) than posterior ones (38 µm). Behind coxae III, 38 barbed setae (Fig. 1). NDV = ~158. Coxalae I-III all barbed.

Gnathosoma long, with nude long posterior hypostomale and shorter nude anterior hypostomale (Fig. 3). One pair of galealae with small setules and pointed. Palp femur and palp genu with one setulose seta. Palp tibia with two barbed setae and one smooth spine-like seta located close to odontus base. Palptarsus with eight setae: six setae nude (including ω and ζ), one seta slightly barbed and one seta near ζ covered with distinct setules (Fig. 4).

Leg setal formula:

Leg I: Ta 1ω, 2ζ, 25B; Ti 2φ, 1κ, 15B; Ge 1σ, 1κ, 8B; Tf 5B; Bf 2B; Tr1B; Cx 1B (Fig. 6).

Leg II: Ta 1ω, 2ζ, 24B; Ti 2φ, 15B; Ge 1κ, 8B; Tf 5B; Bf 2B; Tr 1B; Cx 1B (Fig. 7).

Leg III: Ta 1ζ, 24B; Ti 1φ, 15B; Ge 8B; Tf 5B; Bf 1B; Tr 1B; Cx 1B (Fig. 8).

*Etymology:* This species is named after Biljana, the wife of the senior author.

*Type material:* The holotype (1a) and paratypes (1b, 1c) larvae were collected by Miloje and Biljana Šundić from an unidentified orthopteran insect, 23.09.2013, in Župa, Nikšić, Montenegro. The holotype and paratypes are deposited in the Museum of Natural History of Podgorica (Montenegro).

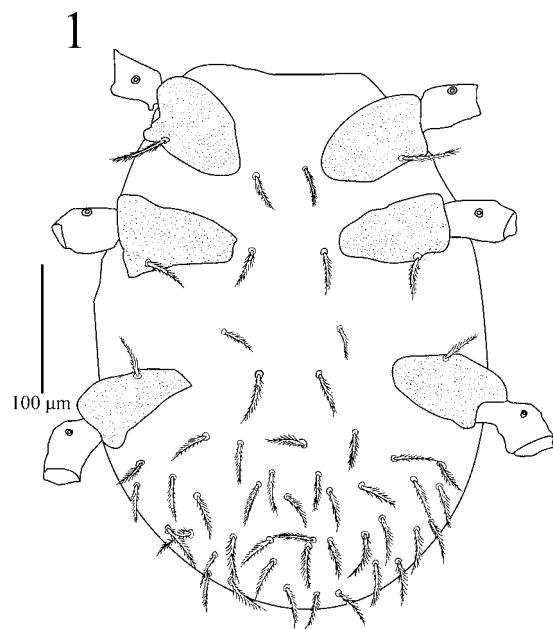

**Remarks:** *Leptus (Leptus) biljanae* belongs to the species group with one palpifemoralia, one palpgenuala, four setae between coxae II – III, fD > 100 and Ti III 130-180 µm. This group includes: *L. (L.) meloidarum* Beron, 1975, *L. (L.) milipedius* Southcott, 1992, *L. (L.) killingtoni* Turk, 1945, *L. (L.) grossi* Southcott, 1999, *L. (L.) clelandi* Southcott, 1999, *L. (L.) clavatus* Southcott, 1999 and *L. (L.) gyas* Fain & D'amico, 1997 (TURK, 1945, BERON, 1975, SOUTHCOTT, 1992, 1999, FAIN & D'AMICO, 1997). Measurements for *L. (L.) meloidarum* and *L. (L.) killingtoni* were given by SOUTHCOTT, (1992), HAITLINGER (1999b, 2006) and LORENZO-CARBALLA et al. (2011). It differs from *L. (L.) meloidarum* in the shorter AW (87-98 vs. 100-110), AA (9-10 vs. 12-15), SB (14-18 vs. 7-8), AP (11-13 vs. 16-24), L (85-93 vs. 108-122), PsFd (63-67 vs. 70-80), PsGd (48-53 vs. 60-68), Ti I (125-132 vs. 140-158), Ti III (152-162 vs. 174-192), L/W (0.67-0.70 vs. 0.73-1.08), fn Ta I-III (25-24-24 vs. 20-22-20) and fn Ti II-Ti III (15-15 vs. 14-14); from *L. (L.) milipedius* in fD (120 vs. 162), fV (38 vs. 57), the shorter AA (9-10 vs. 16-19), SB (7-8 vs. 16-19), AP (11-13 vs. 18-24), L (85-93 vs. 97-111), longer AL (63-67 vs. 47-58),
